AND METHOD OF USE**

CROSS REFERENCE TO RELATED
APPLICATIONS

This application claims priority to U.S. Provisional Patent Application Ser. No. 61/936,397, filed Feb. 6, 2014, which is incorporated herein by reference in its entirety.

BACKGROUND OF THE INVENTION

1. Technical Field

The invention relates to 6-heteroaryloxy- or 6-aryloxy-quinoline-2-carboxamides that are sodium channel (e.g., Na_v1.7 and Na_v1.8) blockers, useful in treating diseases and conditions mediated and modulated by the voltage-gated sodium channels. Additionally, the invention relates to compositions containing compounds of the invention and processes of their preparation.

2. Description of Related Technology

The voltage-gated sodium channels (VGSCs, Na_v1.x) contribute to the initiation and propagation of action potentials in excitable tissues such as nerve and muscle by modulating the influx of sodium ions. Na_v1.7, one of nine sodium channel isoforms, is preferentially expressed in the peripheral nervous system where it acts as a threshold channel for action potential firing in neurons (Cummins T R, et al. *Expert Rev Neurother* 2007; 7:1597-1612. Rush A M, et al. *J Physiol* 2007; 579:1-14.). A wealth of evidence connects abnormal activity of sodium channels in the peripheral nervous system to the pathophysiology of chronic pain (Goldin A L, et al. *Neuron* 2000; 28:365-368. Dib-Hajj S D, et al. *Annu Rev Neurosci* 2010; 33:325-347.). Polymorphisms in SCN9A, the gene that encodes Na_v1.7, cause human pain disorders arising from either gain-of-function or loss-of-function mutations of the channel. Clinically, VGSC blockers have proven useful in the management of pain, but their utility is often limited by incomplete efficacy and poor tolerability. Local anesthetics (e.g., lidocaine), anti-arrhythmic agents (e.g., mexilitene), and anti-convulsants (e.g., lamotrigine) are all relatively weak (IC₅₀ values in the high micromolar range), non-selective (versus Na_v1.x subtypes and other ion channels) VGSC blocking agents identified without prior knowledge of their molecular targets.

The VGSCs are integral plasma membrane proteins composed of a large (260 kDa) α-subunit and one or more smaller β-subunits (Hargus N J et al. *Expert Opin Invest Drugs* 2007; 16:635-646). Nine α-subunits (Na_v1.1-Na_v1.9) and four β-subunits (β1-β4) have been identified in mammals. The various VGSC subtypes exhibit diverse functional properties and distinct expression patterns, suggesting differential involvement in transmission of specific signals. Na_v1.7, Na_v1.8 and Na_v1.9 are expressed predominantly in the peripheral nervous system in humans and rodents (Waxman S G *Brain* 2010; 133:2515-2518). The biophysical characteristics of Na_v1.7 suggest a role in initiation of action potentials, while Na_v1.8 is a major contributor to the upstroke of action potentials in sensory neurons. Na_v1.9 produces a persistent current that is involved in setting the resting membrane potential.

The Na_v1.7 isoform is expressed in both small and large diameter DRG neurons, as well as in sympathetic neurons, and in peripheral axonal termini of neurons processing pain. Na_v1.7 is up-regulated in preclinical models of inflammatory and neuropathic pain, including diabetic neuropathy (Dib-

Hajj S D, et al. *Nat Rev Neurosci*. 2013; 14:49-62. Hong S, et al. *Journal of Biological Chemistry*. 2004; 279:29341-29350. Persson A K, et al. *Exp Neurol*. 2011; 230:273-279.). Na_v1.7 has been shown to accumulate in painful neuromas, such as those in amputees with phantom limb pain, and in painful dental pulp (Beneng K, et al. *BMC Neurosci*. 2010; 11:71. Dib-Hajj S D, et al. *Nat Rev Neurosci*. 2013; 14:49-62). Rare human genetic conditions involving single-nucleotide polymorphisms in SCN9A, the gene encoding for Na_v1.7 highlight its importance in pain pathways. Bi-allelic gain-of-function mutations (enhancing channel activity and increasing the excitability of DRG neurons) produce severe pain syndromes with dominant genetic inheritance. Mutations that hyperpolarize activation voltage dependence (i.e., facilitate channel opening and increase the excitability of DRG neurons) result in inherited erythromelalgia (IEM), a condition characterized by excruciating burning pain, attacks of edema, increased skin temperature and flushing of the skin affecting the distal extremities. Similarly, polymorphisms that impair inactivation of the channel and enhance persistent current lead to paroxysmal extreme pain disorder (PEPD), a condition wherein episodic severe perineal, periocular and paramandibular pain is accompanied by autonomic manifestations such as skin flushing usually in the lower body (Waxman S G *Nature* 2011; 472:173-174. Dib-Hajj S D, et al. *Brain* 2005; 128:1847-1854.). By contrast, bi-allelic loss-of-function mutations preventing the production of functional Na_v1.7 channels produced channelopathy-associated congenital insensitivity to pain (CIP). CIP patients do not perceive or understand pain even when confronted with extreme pain stimuli such as bone fractures, surgery, dental extractions, burns, and childbirth.

The role of Na_v1.7 in pain has been confirmed in knockout studies. Global deletion of Na_v1.7 in knockout mice causes a disruption of normal eating behavior due to a deficit in olfaction, resulting in lethality shortly after birth (Nassar M A, et al. *Proc Natl Acad Sci USA* 2004; 101:12706-12711). A conditional Na_v1.7 knockout in Na_v1.8-expressing DRG neurons abrogated inflammation-induced pain and diminished responses to mechanical insult, but neuropathic pain development was not affected (Nassar M A, et al. *Mol Pain* 2005; 1:24-31). However, ablation of Na_v1.7 in both sensory and sympathetic neurons recapitulated the pain-free phenotype seen in CIP patients, abolishing inflammatory and neuropathic pain without causing any overt autonomic dysfunction (Minett M S, et al. *Nat Commun* 2012; 3:791). Na_v1.7-deficient sensory neurons also failed to release substance P in the spinal cord or to display synaptic potentiation in the dorsal horn of the spinal cord in response to electrical stimulation of the sciatic nerve (Minett M S, et al. *Nat Commun* 2012; 3:791).

The level of preclinical validation for the Na_v1.8 isoform as a target for pain is also compelling. Complementary to Na_v1.7 in its biophysical and functional profile, one Na_v1.8 isoform is expressed in nociceptive trigeminal neurons, in the vast majority of DRG neurons, and in peripheral free nerve endings (Shields S D, et al. *Pain* 2012; 32:10819-10832). An evaluation of Na_v1.8-null mice demonstrated that this channel carries the majority of current underlying the upstroke of action potential in nociceptive neurons. Knockout studies further implicate Na_v1.8 in visceral, cold, and inflammatory pain, but not in neuropathic pain. However, assessment of Na_v1.8 antisense oligonucleotides, also suggested involvement of Na_v1.8 in the development and maintenance of neuropathic pain, in addition to confirming the relevance of the channel in inflammatory pain (Momin A, et al. *Curr Opin Neurobiol* 2008; 18:383-388. Rush A M,

3

et al. J Physiol 2007; 579:1-14. Liu M et al. Pain Med 12 Suppl 2011; 3:593-99.). Human gain-of-function mutations in Na_v1.8 were recently identified in patients with SFN who were all negative for mutations in Na_v1.7 (Faber C G, et al. Proc Natl Acad Sci USA. 2012; 109:19444-19449).

While the literature offers preclinical validation for Na_v1.7 and Na_v1.8 as pain targets, multiple challenges confront the discovery and development of small molecule blockers. The potency needed for efficacy, the levels of selectivity versus the various isoforms required for acceptable therapeutic index, and the relevance of state- and use-dependent activity are not well understood. Although compounds and mechanisms exist that are used clinically to treat pain, there is need for new compounds that can effectively treat different types of pain. Pain of various types (e.g., inflammatory pain, post-surgical pain, osteoarthritis pain, knee pain, lower back pain, neuropathic pain) afflicts virtually all humans and animals at one time or another, and a substantial number of medical disorders and conditions produce some sort of pain as a prominent concern requiring treatment. As such, it would be particularly beneficial to identify new compounds for treating the various types of pain.

Compounds of the invention may exist as stereoisomers wherein asymmetric or chiral centers are present. These stereoisomers are "R" or "S" depending on the configuration of substituents around the chiral carbon atom. The terms "R" and "S" used herein are configurations as defined in IUPAC 1974 Recommendations for Section E, Fundamental Stereochemistry, in Pure Appl. Chem., 1976, 45: 13-30. The invention contemplates various stereoisomers and mixtures thereof and these are specifically included within the scope of this invention. Stereoisomers include enantiomers and diastereomers, and mixtures of enantiomers or diastereomers. Individual stereoisomers of compounds of the invention may be prepared synthetically from commercially available starting materials which contain asymmetric or chiral centers or by preparation of racemic mixtures followed by methods of resolution well-known to those of ordinary skill in the art. These methods of resolution are exemplified by (1) attachment of a mixture of enantiomers to a chiral auxiliary, separation of the resulting mixture of diastereomers by recrystallization or chromatography and optional liberation of the optically pure product from the auxiliary as described in Furniss, Hannaford, Smith, and Tatchell, "Vogel's Textbook of Practical Organic Chemistry", 5th edition (1989), Longman Scientific & Technical, Essex CM20 2JE, England, or (2) direct separation of the mixture of optical enantiomers on chiral chromatographic columns or (3) fractional recrystallization methods.

On occasion, the relative stereochemistry of an enantiomeric pair is known, however, the absolute configuration is not known. In that circumstance, the relative stereochemistry descriptor terms "R*" and "S*" are used. The terms "R*" and "S*" used herein are defined in Eliel, E. L.; Wilen, S. H. Stereochemistry of Organic Compounds; John Wiley & Sons, Inc.: New York, 1994; pp 119-120 and 1206.

Compounds of the invention may exist as cis or trans isomers, wherein substituents on a ring may be attached in such a manner that they are on the same side of the ring (cis) relative to each other, or on opposite sides of the ring relative to each other (trans). For example, cyclobutane may be present in the cis or trans configuration, and may be present as a single isomer or a mixture of the cis and trans isomers.

54

Individual cis or trans isomers of compounds of the invention may be prepared synthetically from commercially available starting materials using selective organic transformations, or prepared in single isomeric form by purification of mixtures of the cis and trans isomers. Such methods are well-known to those of ordinary skill in the art, and may include separation of isomers by recrystallization or chromatography.

It should be understood that the compounds of the invention may possess tautomeric forms, as well as geometric isomers, and that these also constitute an aspect of the invention.

The present invention also includes isotopically-labeled compounds, which are identical to those recited in formula (I), but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes suitable for inclusion in the compounds of the invention are hydrogen, carbon, nitrogen, oxygen, phosphorus, sulfur, fluorine, and chlorine, such as, but not limited to ²H, ³H, ¹³C, ¹⁴C, ¹⁵N, ¹⁸O, ¹⁷O, ³¹P, ³²P, ³⁵S, ¹⁸F, and ³⁶Cl, respectively. Substitution with heavier isotopes such as deuterium, i.e., ²H, can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements and, hence, may be preferred in some circumstances. Compounds incorporating positron-emitting isotopes are useful in medical imaging and positron-emitting tomography (PET) studies for determining the distribution of receptors. Suitable positron-emitting isotopes that can be incorporated in compounds of formula (I) are ¹¹C, ¹³N, ¹⁵O, and ¹⁸F. Isotopically-labeled compounds of formula (I) can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the accompanying Examples using appropriate isotopically-labeled reagent in place of non-isotopically-labeled reagent.

Methods for Preparing Compounds of the Invention

The compounds of the invention can be better understood in connection with the following synthetic schemes and methods which illustrate a means by which the compounds can be prepared.

The compounds of this invention can be prepared by a variety of synthetic procedures. Representative procedures are shown in, but are not limited to, Schemes 1-2.

As shown in Scheme 1, compounds of formula (1-6) can be prepared in a 5-step sequence starting with quinoline-2,6-diol, (1-1). Treatment of quinoline-2,6-diol, (1-1), with phosphoryl chloride in heated N,N-dimethylformamide gives 2-chloroquinolin-6-ol, (1-2). 2-Chloroquinolin-6-ol, (1-2), can then be carbonylated with carbon monoxide (40-70 psi) in the presence of a palladium catalyst such as but not limited to [1,1'-bis(diphenylphosphino)ferrocene] dichloropalladium(II) (Pd(dppf)Cl₂) and a tertiary amine base such as triethyl amine in heated (90-110° C.) methanol to supply methyl 6-hydroxyquinoline-2-carboxylate, (1-3). Methyl 6-hydroxyquinoline-2-carboxylate, (1-3), can then be reacted with X¹-R¹, wherein X¹ is a halogen or sulfonate and R¹ is as described in the Summary, in the presence of a base such as cesium carbonate or potassium carbonate in a heated (60-140° C.) aprotic solvent such as N,N-dimethylformamide or N-methyl-2-pyrrolidinone to give compounds of formula (1-4). The ester of compounds of formula (1-4) can be hydrolyzed with a base such as lithium hydroxide, sodium hydroxide or potassium hydroxide in a mixture of water and tetrahydrofuran to give compounds of formula (1-5). Compounds of formula (1-5) can be reacted with amines or heterocycles, HNR²R³, wherein R² and R³ are as described in the Summary, under amide bond forming conditions to give compounds of formula (1-6). Examples of conditions known to generate amides from a mixture of a carboxylic acid and an amine include but are not limited to adding a coupling reagent such as but not limited to N-(3-dimethylaminopropyl)-N'-ethylcarbodiimide or 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide (EDC, EDAC or EDCI), 1,3-dicyclohexylcarbodiimide (DCC), bis(2-oxo-3-oxazolidinyl)phosphinic chloride (BOPCl), 2-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate or 1-[bis(dimethylamino)methylene]-1H-1,2,3-triazolo[4,5-b]pyridinium 3-oxid hexafluorophosphate (HATU), O-(benzotriazol-1-yl)-N,N,N',N'-tetramethyluronium tetrafluoroborate (TBTU), 2-(1H-benzo[d][1,2,3]triazol-1-yl)-1,1,3,3-tetramethylisouronium hexafluorophosphate(V) (HBTU), and 2,4,6-tripropyl-1,3,5,2,4,6-trioxatriphosphinane 2,4,6-trioxide (T3P®). The coupling reagents may be added as a solid, a solution, or as the reagent bound to a solid support resin. In addition to the

56

coupling reagents, auxiliary-coupling reagents may facilitate the coupling reaction. Auxiliary coupling reagents that are often used in the coupling reactions include but are not limited to (dimethylamino)pyridine (DMAP), 1-hydroxy-7-azabenzotriazole (HOAT) and 1-hydroxybenzotriazole (HOBT). The reaction may be carried out optionally in the presence of a base such as triethylamine or diisopropylethylamine. The coupling reaction may be carried out in solvents such as but not limited to tetrahydrofuran, N,N-dimethylformamide, N,N-dimethylacetamide, dimethyl sulfoxide, dichloromethane, and ethyl acetate. The compounds of formula (1-6) are representative of compounds of formula (I). Compounds of formula (1-6) can be further transformed using the methodologies described in the Examples to give additional compounds of formula (I).

As shown in Scheme 2, compounds of formula (1-6) can also be prepared in an alternative sequence starting with methyl 6-hydroxyquinoline-2-carboxylate, (1-3). Methyl 6-hydroxyquinoline-2-carboxylate, (1-3), can be hydrolyzed at or near ambient temperature with a base such as lithium hydroxide, sodium hydroxide or potassium hydroxide in a mixture of water and tetrahydrofuran to give 6-hydroxyquinoline-2-carboxylic acid, (2-1). 6-Hydroxyquinoline-2-carboxylic acid, (2-1), can be reacted with amines or heterocycles, HNR²R³, wherein R² and R³ are as described in the Summary, under amide bond forming conditions to give compounds of formula (2-2). Examples of conditions known to generate amides from a mixture of a carboxylic acid and an amine are described in Scheme 1 for the conversion of compounds of formula (1-5) to compounds of formula (1-6). Compounds of formula (2-2), can then be reacted with X¹-R¹, wherein X¹ is a halogen or sulfonate and R¹ is as described in the Summary, in the presence of a base such as

cesium carbonate or potassium carbonate in a heated (60-140° C.) aprotic solvent such as N,N-dimethylformamide or N-methyl-2-pyrrolidinone to give compounds of formula (1-6). The compounds of formula (1-6) are representative of compounds of formula (I). Compounds of formula (1-6) can be further transformed using the methodologies described in the Examples to give additional compounds of formula (I).

The compounds and intermediates of the invention may be isolated and purified by methods well-known to those skilled in the art of organic synthesis. Examples of conventional methods for isolating and purifying compounds can include, but are not limited to, chromatography on solid supports such as silica gel, reversed phase C8- or C18-bonded silica, alumina, or silica derivatized with alkylsilane groups using elution with water, organic solvents, or solvent combinations with or without the addition buffers or other additives such as trifluoroacetic acid or ammonium acetate, by recrystallization at high or low temperature with an optional pretreatment with activated carbon, thin-layer chromatography, distillation at various pressures, sublimation under vacuum, and trituration, as described for instance in "Vogel's Textbook of Practical Organic Chemistry", 5th edition (1989), by Furniss, Hannaford, Smith, and Tatchell, pub. Longman Scientific & Technical, Essex CM20 2JE, England. Basic amine containing compounds purified using chromatography in the presence of additives such as trifluoroacetic acid, may be isolated as salts.

Many of the compounds of the invention have at least one basic nitrogen whereby the compound can be treated with an acid to form a desired salt. For example, a compound may be reacted with an acid at or above room temperature to provide the desired salt, which is deposited, and collected by filtration after cooling. Examples of acids suitable for the reaction include, but are not limited to tartaric acid, lactic acid, succinic acid, as well as mandelic, atrolactic, methanesulfonic, ethanesulfonic, toluenesulfonic, naphthalene-sulfonic, benzenesulfonic, carbonic, fumaric, maleic, gluconic, acetic, propionic, salicylic, hydrochloric, hydrobromic, phosphoric, sulfuric, citric, hydroxybutyric, camphorsulfonic, malic, phenylacetic, aspartic, trifluoroacetic acid or glutamic acid, and the like.

Optimum reaction conditions and reaction times for each individual step can vary depending on the particular reactants employed and substituents present in the reactants used. Unless otherwise specified, solvents, temperatures and other reaction conditions can be readily selected by one of ordinary skill in the art. Specific procedures are provided in the Examples section. Reactions can be worked up in the conventional manner, e.g. by eliminating the solvent from the residue and further purified according to methodologies generally known in the art such as, but not limited to, crystallization, distillation, extraction, trituration and chromatography. Unless otherwise described, the starting materials and reagents are either commercially available or can be prepared by one skilled in the art from commercially available materials using methods described in the chemical literature.

Routine experimentations, including appropriate manipulation of the reaction conditions, reagents and sequence of the synthetic route, protection of any chemical functionality that cannot be compatible with the reaction conditions, and deprotection at a suitable point in the reaction sequence of the method are included in the scope of the invention. Suitable protecting groups and the methods for protecting and deprotecting different substituents using such suitable protecting groups are well known to those skilled in the art; examples of which can be found in P G M Wuts and T W

Greene, in Greene's book titled Protective Groups in Organic Synthesis (4th ed.), John Wiley & Sons, NY (2006), which is incorporated herein by reference in its entirety. Synthesis of the compounds of the invention can be accomplished by methods analogous to those described in the synthetic schemes described hereinabove and in specific examples.

Starting materials, if not commercially available, can be prepared by procedures selected from standard organic chemical techniques, techniques that are analogous to the synthesis of known, structurally similar compounds, or techniques that are analogous to the above described schemes or the procedures described in the synthetic examples section.

When an optically active form of a compound of the invention is required, it can be obtained by carrying out one of the procedures described herein using an optically active starting material (prepared, for example, by asymmetric induction of a suitable reaction step), or by resolution of a mixture of the stereoisomers of the compound or intermediates using a standard procedure (such as chromatographic separation, recrystallization or enzymatic resolution).

Similarly, when a pure geometric isomer of a compound of the invention is required, it can be obtained by carrying out one of the above procedures using a pure geometric isomer as a starting material, or by resolution of a mixture of the geometric isomers of the compound or intermediates using a standard procedure such as chromatographic separation.

It can be appreciated that the synthetic schemes and specific examples as illustrated in the Examples section are illustrative and are not to be read as limiting the scope of the invention as it is defined in the appended claims. All alternatives, modifications, and equivalents of the synthetic methods and specific examples are included within the scope of the claims.

Compositions of the Invention

The invention also provides pharmaceutical compositions comprising a therapeutically effective amount of a compound of formula (I) in combination with a pharmaceutically acceptable carrier. The compositions comprise compounds of the invention formulated together with one or more non-toxic pharmaceutically acceptable carriers. The pharmaceutical compositions can be formulated for oral administration in solid or liquid form, for parenteral injection, for topical administration, or for rectal administration.

The term "pharmaceutically acceptable carrier", as used herein, means a non-toxic, inert solid, semi-solid or liquid filler, diluent, encapsulating material or formulation auxiliary of any type. Some examples of materials which can serve as pharmaceutically acceptable carriers are sugars such as lactose, glucose and sucrose; starches such as corn starch and potato starch; cellulose and its derivatives such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatin; talc; cocoa butter and suppository waxes; oils such as peanut oil, cottonseed oil, safflower oil, sesame oil, olive oil, corn oil and soybean oil; glycols; such a propylene glycol; esters such as ethyl oleate and ethyl laurate; agar; buffering agents such as magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water; isotonic saline; Ringer's solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible lubricants such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and anti-

oxidants can also be present in the composition, according to the judgment of one skilled in the art of formulations.

The pharmaceutical compositions of this invention can be administered to humans and other mammals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments or drops), buccally or as an oral or nasal spray. The term "parenterally", as used herein, refers to modes of administration which include intravenous, intramuscular, intraperitoneal, intrasternal, subcutaneous, intraarticular injection and infusion.

Pharmaceutical compositions for parenteral injection comprise pharmaceutically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions and sterile powders for reconstitution into sterile injectable solutions or dispersions. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyols (propylene glycol, polyethylene glycol, glycerol, and the like, and suitable mixtures thereof), vegetable oils (such as olive oil) and injectable organic esters such as ethyl oleate, or suitable mixtures thereof. Suitable fluidity of the composition may be maintained, for example, by the use of a coating such as lecithin, by the maintenance of the required particle size in the case of dispersions, and by the use of surfactants.

These compositions may also contain adjuvants such as preservative agents, wetting agents, emulsifying agents, and dispersing agents. Prevention of the action of microorganisms may be ensured by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, and the like. It may also be desirable to include isotonic agents, for example, sugars, sodium chloride and the like. Prolonged absorption of the injectable pharmaceutical form may be brought about by the use of agents delaying absorption, for example, aluminum monostearate and gelatin.

In some cases, in order to prolong the effect of a drug, it is often desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution which, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle.

Suspensions, in addition to the active compounds, may contain suspending agents, for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar, tragacanth, and mixtures thereof.

If desired, and for more effective distribution, the compounds of the invention can be incorporated into slow-release or targeted-delivery systems such as polymer matrices, liposomes, and microspheres. They may be sterilized, for example, by filtration through a bacteria-retaining filter or by incorporation of sterilizing agents in the form of sterile solid compositions, which may be dissolved in sterile water or some other sterile injectable medium immediately before use.

Injectable depot forms are made by forming microencapsulated matrices of the drug in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations also are prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissues.

The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium just prior to use.

Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution, suspension or emulsion in a nontoxic, parenterally acceptable diluent or solvent such as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectables.

Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, one or more compounds of the invention is mixed with at least one inert pharmaceutically acceptable carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and salicylic acid; b) binders such as carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidone, sucrose, and *acacia*; c) humectants such as glycerol; d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate; e) solution retarding agents such as paraffin; f) absorption accelerators such as quaternary ammonium compounds; g) wetting agents such as cetyl alcohol and glycerol monostearate; h) absorbents such as kaolin and bentonite clay; and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using lactose or milk sugar as well as high molecular weight polyethylene glycols.

The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract in a delayed manner. Examples of materials which can be useful for delaying release of the active agent can include polymeric substances and waxes.

Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at ambient temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers

61

such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof

Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

Dosage forms for topical or transdermal administration of a compound of this invention include ointments, pastes, creams, lotions, gels, powders, solutions, sprays, inhalants or patches. A desired compound of the invention is admixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives or buffers as may be required. Ophthalmic formulation, ear drops, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

The ointments, pastes, creams and gels may contain, in addition to an active compound of this invention, animal and vegetable fats, oils, waxes, paraffins, starch, tragacanth, cellulose derivatives, polyethylene glycols, silicones, bentonites, silicic acid, talc and zinc oxide, or mixtures thereof.

Powders and sprays can contain, in addition to the compounds of this invention, lactose, talc, silicic acid, aluminum hydroxide, calcium silicates and polyamide powder, or mixtures of these substances. Sprays can additionally contain customary propellants such as chlorofluorohydrocarbons.

Compounds of the invention may also be administered in the form of liposomes. As is known in the art, liposomes are generally derived from phospholipids or other lipid substances. Liposomes are formed by mono- or multi-lamellar hydrated liquid crystals that are dispersed in an aqueous medium. Any non-toxic, physiologically acceptable and metabolizable lipid capable of forming liposomes may be used. The present compositions in liposome form may contain, in addition to the compounds of the invention, stabilizers, preservatives, and the like. The preferred lipids are the natural and synthetic phospholipids and phosphatidylcholines (lecithins) used separately or together.

Methods to form liposomes are known in the art. See, for example, Prescott, Ed., *Methods in Cell Biology*, Volume XIV, Academic Press, New York, N.Y., (1976), p 33 et seq.

Dosage forms for topical administration of a compound of this invention include powders, sprays, ointments and inhalants. The active compound is mixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives, buffers or propellants, which can be required. Ophthalmic formulations, eye ointments, powders and solutions are contemplated as being within the scope of this invention. Aqueous liquid compositions comprising compounds of the invention also are contemplated.

In the case of compounds containing carboxylic acid groups, the pharmaceutically acceptable esters are prepared from compounds containing the carboxylic acid groups by reaction of the compound with base such as triethylamine and an alkyl halide, alkyl triflate, for example with methyl iodide, benzyl iodide, cyclopentyl iodide. They also may be prepared by reaction of the compound with an acid such as hydrochloric acid and an alcohol such as methanol or ethanol.

The term "pharmaceutically acceptable amide", as used herein, refers to non-toxic amides of the invention derived from ammonia, primary C₁-to-C₆-alkyl amines and secondary C₁-to-C₆-dialkyl amines. In the case of secondary amines, the amine may also be in the form of a 5- or 6-membered heterocycle containing one nitrogen atom. Amides derived from ammonia, C₁-to-C₃-alkyl primary amides and C₁-to-C₂-dialkyl secondary amides are preferred. Amides of the compounds of formula (I) may be prepared according to conventional methods. The composition can contain a compound of the invention in the form of a pharmaceutically acceptable prodrug.

The invention contemplates pharmaceutically active compounds either chemically synthesized or formed by in vivo biotransformation to compounds of formula (I).

Methods of the Invention

The compounds and compositions of the invention are useful for treating and preventing certain diseases and disorders in humans and animals. As an important consequence of the ability of the compounds of the invention to modulate the effects of voltage-gated sodium channels (e.g., Na_v1.7 and Na_v1.8) in cells, the compounds described in the invention can affect physiological processes in humans and animals. In this way, the compounds and compositions described in the invention are useful for treating and preventing diseases and disorders modulated by voltage-gated sodium channels, e.g., Na_v1.7 and Na_v1.8. Typically, treatment or prevention of such diseases and disorders can be effected by selectively modulating voltage-gated sodium channels, e.g., Na_v1.7 and Na_v1.8, in a mammal, by administering a compound or composition of the invention, either alone or in combination with another active agent as part of a therapeutic regimen.

The terms "treat," "treating," and "treatment" are readily understood by a physician of ordinary skill and, with respect to treatment of a particular condition, can include ameliorating, suppressing, eradicating, preventing, reducing the risk of, and/or delaying the onset of the disease being treated.

The term "subject" includes animals such as mammals, including primates (e.g., humans), cows, sheep, goats,

horses, dogs, cats, rabbits, rats, mice and the like. The methods of treatment are particularly suitable for use with a human subject, but may be used with other animal subjects, particularly mammals.

One embodiment of the present invention provides a method of treating pain in a subject in need thereof. The method comprises administering to the subject, including a mammal, such as a human, a therapeutically effective amount of a compound of formula (I), or a pharmaceutically acceptable salt thereof. Conditions related to pain include, for example, acute pain, chronic pain, neuropathic pain, nociceptive pain, allodynia, inflammatory pain, inflammatory hyperalgesia, post herpetic neuralgia, post-operative pain, post-stroke pain, neuropathies, neuralgia, diabetic neuropathy, HIV-related neuropathy, nerve injury, rheumatoid arthritic pain, osteoarthritic pain, burns, back pain, eye pain, visceral pain, cancer pain, dental pain, headache, migraine, carpal tunnel syndrome, knee pain, fibromyalgia, neuritis, sciatica, pelvic hypersensitivity, pelvic pain, menstrual pain.

Pain generally can be classified as acute or chronic. Acute pain begins suddenly and is short-lived (usually twelve weeks or less). It is usually associated with a specific cause such as a specific injury and is often sharp and severe. It is the kind of pain that can occur after specific injuries resulting from surgery, dental work, a strain or a sprain. Acute pain does not generally result in any persistent psychological response. In contrast, chronic pain is long-term pain, typically persisting for more than three months and leading to significant psychological and emotional problems. Common examples of chronic pain include neuropathic pain (e.g., painful diabetic neuropathy, postherpetic neuralgia), carpal tunnel syndrome, back pain, headache, cancer pain, arthritic pain and chronic post-surgical pain. In one embodiment, the condition related to pain is chronic pain. In another embodiment, the condition related to pain is acute pain.

Pain also can be divided into a number of different subtypes according to differing pathophysiology, including neuropathic, nociceptive, and inflammatory pain. Some types of pain have multiple etiologies and can be classified in more than one area, e.g., back pain and cancer pain have both nociceptive and neuropathic components.

In one embodiment, the condition related to pain is selected from the group consisting of neuropathic pain, nociceptive pain, and inflammatory pain.

In another embodiment, the condition related to pain is neuropathic pain. Neuropathic pain generally is defined as pain initiated or caused by a primary lesion or dysfunction in the nervous system and can result, for example, from trauma or disease. The term neuropathic pain encompasses many conditions with diverse etiologies including peripheral neuropathy, diabetic neuropathy, post-herpetic neuralgia, trigeminal neuralgia, back pain, cancer neuropathy, HIV-neuropathy, phantom limb pain, carpal tunnel syndrome, central post-stroke pain, and pain associated with chronic alcoholism, hypothyroidism, uremia, multiple sclerosis, spinal cord injury, Parkinson's disease, epilepsy and vitamin deficiency.

In another embodiment, the condition related to pain is nociceptive pain. Nociceptive pain is induced by tissue injury or by intense stimuli with the potential to cause injury. When a substantial injury occurs to body tissue through trauma or disease, the characteristics of nociceptor activation are altered and there is sensitization in the periphery leading to a heightened sensation of pain in the subject. Moderate to severe acute nociceptive pain is a prominent feature of pain from central nervous system trauma, strains, sprains, burns, myocardial infarction and acute pancreatitis,

post-operative pain (pain following any type of surgical procedure), post-traumatic pain, renal colic, cancer pain and back pain. Cancer pain can be chronic pain such as tumor related pain (e.g., bone pain, headache, facial pain or visceral pain) or pain associated with cancer therapy (e.g., post-chemotherapy syndrome, chronic postsurgical pain syndrome or post radiation syndrome). Cancer pain can also occur in response to chemotherapy, immunotherapy, hormonal therapy or radiotherapy. Back pain can be due to herniated or ruptured intervertebral discs or abnormalities of the lumbar facet joints, sacroiliac joints, paraspinal muscles or the posterior longitudinal ligament.

In another embodiment, the condition related to pain is inflammatory pain. A common type of inflammatory pain is arthritic pain arising from rheumatoid disease (such as ankylosing spondylitis) or symptomatic osteoarthritis or degenerative joint disease. Another type of inflammatory pain is visceral pain. Visceral pain is pain associated with the viscera, which encompass the organs of the abdominal cavity including the sex organs, spleen and part of the digestive system. Pain associated with the viscera can be divided into digestive visceral pain and non-digestive visceral pain. Commonly encountered gastrointestinal disorders that cause pain include functional bowel disorder and inflammatory bowel disease. These gastrointestinal disorders include a wide range of disease states that are currently only moderately controlled, including, with respect to functional bowel disorder, gastro-esophageal reflux, dyspepsia, irritable bowel syndrome, and functional abdominal pain syndrome, and, in respect of inflammatory bowel disease, Crohn's disease, ileitis and ulcerative colitis, all of which regularly produce visceral pain. Other types of visceral pain include the pain associated with dysmenorrhea, cystitis and pancreatitis and pelvic pain.

In another embodiment, the condition related to pain results from a musculo-skeletal condition such as myalgia, fibromyalgia, spondylitis, sero-negative (non-rheumatoid) arthropathies, non-articular rheumatism, dystrophinopathy, glycogenolysis, polymyositis and pyomyositis; heart and vascular pain, including pain caused by angina, myocardial infarction, mitral stenosis, pericarditis, Raynaud's phenomenon, scleredoma and skeletal muscle ischemia; head pain, such as migraine (including migraine with aura and migraine without aura), cluster headache, tension-type headache mixed headache and headache associated with vascular disorders; and orofacial pain, including dental pain, otic pain, burning mouth syndrome, temporomandibular myofascial pain, and paroxysmal extreme pain disorder (PEPD); and inherited erythromelalgia (IEM).

In some embodiments, the methods comprise combination therapy, wherein the compound(s) and/or salt(s) of the invention is/are co-administered with a second (or even a third, fourth, etc.) compound, such as, for example, another therapeutic agent used to treat pain. The compound(s) and/or salt(s) of this invention can also be co-administered with therapeutic agents other than therapeutic agents used to treat pain. In these co-administration embodiments, the compound(s) and/or salt(s) of the invention and the second, etc. therapeutic agent(s) may be administered in a substantially simultaneous manner (e.g., or within about five minutes of each other), in a sequential manner, or both. It is contemplated that such combination therapies may include administering one therapeutic agent multiple times between the administrations of the other. The time period between the administration of each agent may range from a few seconds (or less) to several hours or days, and will depend on, for example, the properties of each composition and active

ingredient (e.g., potency, solubility, bioavailability, half-life, and kinetic profile), as well as the condition of the patient. The compound(s) and/or salt(s) of this invention and the second, etc. therapeutic agent may also be administered in a single formulation.

In certain embodiments, the method comprises co-administering to the subject the compound(s) and/or salt(s) of the invention with one or more compounds selected from the group consisting of nonsteroidal anti-inflammatory drugs (NSAIDs), opioid analgesics, barbiturates, benzodiazepines, histamine antagonists, sedatives, skeletal muscle relaxants, transient receptor potential ion channel antagonists, α -adrenergics, tricyclic antidepressants, anticonvulsants, tachykinin antagonists, muscarinic antagonists, cyclooxygenase-2 selective inhibitors, neuroleptics, vanilloid receptor agonists, vanilloid receptor antagonists, β -adrenergics, local anesthetics, corticosteroids, 5-HT receptor agonists, 5-HT receptor antagonists, 5-HT_{2A} receptor antagonists, cholinergic analgesics, $\alpha_2\delta$ ligands (such as gabapentin or pregabalin), cannabinoid receptor ligands, metabotropic glutamate subtype 1 receptor antagonists, serotonin reuptake inhibitors, norepinephrine reuptake inhibitors, dual serotonin-noradrenaline reuptake inhibitors, Rho kinase inhibitors, inducible nitric oxide synthase inhibitors, acetylcholinesterase inhibitors, prostaglandin E₂ subtype 4 antagonists, leukotriene B₄ antagonists, 5-lipoxygenase inhibitors, sodium channel blockers, 5-HT₃ antagonists, N-methyl-D-aspartic acid receptor antagonists, phosphodiesterase V inhibitors, voltage-gated calcium channel blockers (e.g., N-type and T-type), and KCNQ openers (e.g., KCNQ2/3 (K_v7.2/3)).

In one embodiment, the method comprises administering to the subject a therapeutically effective amount of a compound described herein, or a pharmaceutically acceptable salt, with or without a pharmaceutically acceptable carrier, in combination with a second therapeutic agent selected from the group consisting of acetaminophen, NSAIDs, opioid analgesics, and combinations thereof.

In one embodiment, the method comprises administering to the subject a therapeutically effective amount of a compound described herein, or a pharmaceutically acceptable salt, with or without a pharmaceutically acceptable carrier, in combination with one or more additional therapeutic agents for treating pain. In one embodiment, the additional therapeutic agent is selected from the group consisting of acetaminophen, NSAIDs (such as aspirin, ibuprofen, and naproxen), and opioid analgesics. In another embodiment, the additional therapeutic agent is acetaminophen. In another embodiment, the additional therapeutic agent is an NSAID. In another embodiment, the additional therapeutic agent is an opioid analgesic.

The present invention also is directed, in part, to one or more compounds and/or salts of the invention for use in the treatment of a voltage-gated sodium channel-mediated condition, such as pain.

Actual dosage levels of active ingredients in the pharmaceutical compositions of this invention can be varied so as to obtain an amount of the active compound(s) that is effective to achieve the desired therapeutic response for a particular patient, compositions and mode of administration. The selected dosage level will depend upon the activity of the particular compound, the route of administration, the severity of the condition being treated and the condition and prior medical history of the patient being treated. However, it is within the skill of the art to start doses of the compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

When used in the above or other treatments, a therapeutically effective amount of one of the compounds of the invention can be employed in pure form or, where such forms exist, in pharmaceutically acceptable salt or ester, or amide form. Alternatively, the compound can be administered as a pharmaceutical composition containing the compound of interest in combination with one or more pharmaceutically acceptable carriers. The phrase "therapeutically effective amount" of the compound of the invention means a sufficient amount of the compound to treat disorders, at a reasonable benefit/risk ratio applicable to any medical treatment. It will be understood, however, that the total daily usage of the compounds and compositions of the invention will be decided by the attending physician within the scope of sound medical judgment. The specific therapeutically effective dose level for any particular patient will depend upon a variety of factors including the disorder being treated

68

and the severity of the disorder; activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed; and like factors well known in the medical arts. For example, it is well within the skill of the art to start doses of the compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

For treatment or prevention of disease, the total daily dose of the compounds of this invention administered to a human or lower animal may range from about 0.0003 to about 100 mg/kg/day. For purposes of oral administration, more preferable doses can be in the range of from about 0.0003 to about 30 mg/kg/day. If desired, the effective daily dose can be divided into multiple doses for purposes of administration; consequently, single dose compositions may contain such amounts or submultiples thereof to make up the daily dose.

The compounds and processes of the invention will be better understood by reference to the following examples, which are intended as an illustration of and not a limitation upon the scope of the invention.

[(2S*)-2-(difluoromethyl)piperazin-1-yl]{{6-{{5-(trifluoromethyl)pyridin-2-yl}oxy}quinolin-2-yl}methanone

The product from Example 25B (1.39 g, 3.07 mmol) was subjected to preparative super critical fluid chromatography

(SFC) to give 589 mg of the titled compound as a single enantiomer (second to elute, t_R=5.28 minutes, >99% ee). Preparative SFC was performed on a THAR/Waters SFC 80 system running under SuperChrom software control. The preparative SFC system was equipped with an 8-way preparative column switcher, CO₂ pump, modifier pump, automated back pressure regulator (ABPR), UV detector, and 6-position fraction collector. The mobile phase comprised of supercritical CO₂ supplied by a Dewar of bone-dry non-certified CO₂ pressurized to 350 psi with a modifier of methanol buffered with 0.3% diethylamine at a flow rate of 70 g/minute. UV detection was set to collect at a wavelength of 220 nm, the column was at ambient temperature, and the backpressure regulator was set to maintain 100 bar. The sample was dissolved in methanol at a concentration of 40 mg/mL. The sample was loaded into the modifier stream in 1.5 mL (40 mg) injections. The mobile phase was held isocratically at 30% methanol:CO₂. Fraction collection was time triggered. The instrument was fitted with a CHIRAL-CEL® OZ-H column with dimensions 21 mm i.d.×250 mm length with 5 μm particles.

Analytical SFC was performed on an Aurora A5 SFC Fusion and Agilent 1100 system running under Agilent Chemstation software control. The SFC system included a 10-way column switcher, CO₂ pump, modifier pump, oven, and backpressure regulator. The mobile phase comprised of supercritical CO₂ supplied by a beverage-grade CO₂ cylinder with a modifier mixture of methanol buffered with 0.1% diethylamine at a flow rate of 3 mL/minute. Oven temperature was at 35° C. and the outlet pressure at 150 bar. The mobile phase gradient started with 5% modifier and held it for 0.1 minutes at a flow rate of 1 mL/minute, then the flow rate was ramped up to 3 mL/minute and held for 0.4 minutes. The modifier was ramped from 5% to 50% over the next 8 minutes at 3 mL/minute then held for 1 minute at 50% modifier (3 mL/minute). The gradient was ramped down from 50% to 5% modifier over 0.5 minutes (3 mL/minute). The instrument was fitted with a CHIRALCEL® OZ-H column with dimensions of 4.6 mm i.d.×150 mm length with 5 μm particles.

It is an enantiopure sample, but the absolute stereochemistry was not determined. ¹H NMR (500 MHz, DMSO-d₆, rotamers) δ ppm 8.59 (s, 1H), 8.50 (d, J=8.5 Hz, 1H), 8.30 (dd, J=8.7, 2.5 Hz, 1H), 8.12 (t, J=8.9 Hz, 1H), 7.90 (d, J=2.6 Hz, 1H), 7.74-7.71 (m, 1H), 7.69 (dd, J=8.5, 7.0 Hz, 1H), 7.40 (dd, J=8.7, 3.7 Hz, 1H), 6.55 (tdd, J=57.0, 37.5, 6.7 Hz, 1H), 4.82-4.74 (m, 0.5H), 4.43-4.34 (m, 0.5H), 4.35-4.27 (m, 0.5H), 3.56 (d, J=13.3 Hz, 0.5H), 3.39-3.34 (m, 0.5H), 3.16 (d, J=13.1 Hz, 0.5H), 3.09-2.93 (m, 2H), 2.87-2.77 (m, 1H), 2.76-2.68 (m, 0.5H), 2.63-2.55 (m, 1.5H); MS (ESI) m/z 453.1 [M+H]⁺.

FRET-Based Membrane Potential Assays.

Recombinant, Human Sodium Channel, Na_v1.7.

Two days prior to the experiment, frozen HEK293 cells stably expressing recombinant human Na_v1.7 were quickly thawed and plated at 25,000 cells/well in growth medium [DMEM (Invitrogen #11965) with 10% HI FBS (Invitrogen #10082), 2 mM glutamine, 100 units/mL penicillin, 0.1 mg/mL streptomycin (PSG, Sigma #G1146), and 500 µg/mL Geneticin (Invitrogen #10131)] in black-walled, clear-bottom 384-well poly-D-lysine-coated assay plates (Greiner Bio-One, Frickenhausen, Germany) and incubated in a humidified 5% CO₂ incubator at 37° C. On the day of the assay, medium was removed by aspiration, and cells were washed with assay buffer [HBSS (Invitrogen, Carlsbad, Calif.) containing 20 mM HEPES (Invitrogen, Carlsbad, Calif.)]. After washing, 30 µL assay buffer containing the fluorescent voltage-sensor probe CC2-DMPE (Invitrogen, Carlsbad, Calif.) at 20 µM and 0.01% pluronic F-127 (Invitrogen, Carlsbad, Calif.) was added to the cells. Cells were incubated for 40 minutes at room temperature in the dark. Following the incubation, the cells were washed and

30 µL assay buffer containing 2.5 µM DiSBAC₂(3) substrate (Invitrogen, Carlsbad, Calif.) and 0.5 mM VABSC-1 (Invitrogen, Carlsbad, Calif.) was added to the cells. The cells were incubated for 90 minutes at room temperature in the dark. Fluorescence readings were made using a FLIPR®^{TETRA} (Molecular Devices, Sunnyvale Calif.) equipped with voltage-sensor probe optics. At the start of each experiment the optimal (EC₈₀) concentration of depolarizing agent (veratridine) was determined by testing a dilution curve of assay buffer containing veratridine (Sigma-Aldrich, St. Louis, Mo.) and 1 mg/mL scorpion venom (SVqq, from Leiurus quinquestriatus; Sigma-Aldrich, St. Louis, Mo.). Compounds were dissolved in dimethyl sulfoxide, and 8-point, 1:3 dilution concentration-response curves were prepared in duplicate in dimethyl sulfoxide, followed by preparation of 0.8 µL/well daughter plates of the dilutions. Test compounds in the daughter plate were diluted to (~3×) solutions in assay buffer immediately before assaying. Using the FLIPR®^{TETRA}, 20 µL of the (3×) compound solutions were first added to the cells, then 20 µL of depolarizing solution (3×EC₈₀ veratridine+SVqq) were added 3 minutes later to activate the channel. Changes in fluorescence were measured at wavelengths of 440-480 nm and 565-625 nm over the course of the experimental run. Membrane depolarization was expressed as a ratio of the maximum $F_{440-480\text{ nm}}/F_{565-625\text{ nm}}$ reading above average baseline $F_{440-480\text{ nm}}/F_{565-625\text{ nm}}$ reading. IC₅₀ values were calculated from curve fits of the ratio data using a four-parameter logistic Hill equation (Accelrys Assay Explorer 3.3 Client, Accelrys, San Diego, Calif.) with percent inhibition plotted against compound concentration.

The concentration of veratridine chosen for the assay, the “EC₈₀”, was where the assay achieved maximum signal with the dimethyl sulfoxide control, minimal inhibition with 0.01 µM tetracaine, ~50% inhibition with 0.06 µM tetracaine, and >50% inhibition with 0.1 µM tetracaine. Osteoarthritic (OA) Pain Induced by Sodium Monoiodoacetate (MIA)

Pain behavior was assessed by measurement of hind limb grip force (GF) in adult osteoarthritic rats. Male Sprague Dawley rats, obtained from Charles River Laboratories, (Wilmington, Mass.), weighing 150-175 g, were injected in the unilateral knee joint with a single intra-articular injection of sodium monoiodoacetate (MIA, 3 mg/rat). All rats were tested at 20 days following MIA injection. A behavioral measure of activity-induced pain was carried out. Measurements of the peak hind limb grip force were conducted by recording the maximum compressive force (CFmax), in grams of force, exerted on a hind limb strain gauge setup, in a commercially available grip force measurement system (Columbus Instruments, Columbus, Ohio).

During testing, each rat was gently restrained by grasping it around its rib cage and then allowed to grasp the wire mesh frame attached to the strain gauge. The experimenter then moved the animal in a rostral-to-caudal direction until the grip was broken. Each rat was sequentially tested twice at an approximately 2-3 minute interval to obtain a raw mean grip force (CFmax). This raw mean grip force data was in turn converted to a maximum hindlimb cumulative compressive force (CFmax), as the grams of force/kg of body weight, for each animal.

For evaluating the compound effects, the hind limb grip force was conducted 20 days following the intra-articular injection of MIA. A group of age-matched naïve (not injected with MIA) animals was added as a comparator to the drug-dosed groups. The vehicle control response for each group of MIA-treated animals was defined as the 0% response (0% effect), whereas the naïve control group was defined as the normal response and as 100% effect. The % effect for each dose group was expressed as % return of response to normalcy, compared to the naïve group. A percent maximal possible effect (% MPE) of testing com-

pound was calculated according to the formula: (Treatment CFmax–Vehicle CFmax)/Vehicle CFmax]×100). Higher % effect numbers indicate increased relief from the pain in the model, with 100% indicating a return to the level of response seen in normal (non-osteoarthritic) animals. All experiments evaluating drug effects in this model were conducted in a randomized blinded fashion.

The animals were housed in Association for Assessment and Accreditation of Laboratory Animal Care (AAALAC) approved facilities at AbbVie Inc. in a temperature-regulated environment under a controlled 12-hour light-dark cycle, with lights on at 6:00 a.m. Food and water were available ad libitum at all times except during testing. All testing was done following procedures outlined in protocols approved by AbbVie Inc.’s Institutional Animal Care and Use Committee.

Rat Spinal Nerve Ligation (SNL) Model of Neuropathic Pain.

A model of spinal nerve ligation-induced (SNL model) neuropathic pain as originally described by Kim and Chung (Kim, S. H. and J. M. Chung, 1992, Pain 50, 355) was used to test a compound of the present application. The male Sprague Dawley rats (Charles River Laboratories, Wilmington, Mass.), weighing 150-175 g at the time of surgery, were placed under isoflurane anesthesia and a 1.5 cm incision was made dorsal to the lumbosacral plexus. The paraspinal muscles (left side) were separated from the spinous processes, the left L5 and L6 spinal nerves isolated, and tightly ligated with 5-0 silk suture distal to the dorsal root ganglion. Care was taken to avoid ligating the L4 spinal nerve. Following spinal nerve ligation, a minimum of 7 days of recovery and no more than 3 weeks was allowed prior to the behavioral testing (mechanical sensitivity). Only rats with threshold scores ≤4.5 g were considered allodynic and utilized in pharmacological experiments.

Mechanical sensitivity was measured using calibrated von Frey filaments (Stoelting, Wood Dale, Ill.). Paw withdrawal threshold (PWT) was determined by using the Dixon’s up-down method (Dixon, W. J., 1980, Ann. Rev. Pharmacol. Toxicol., 20, 441). Rats were placed into inverted individual plastic containers (20×12.5×20 cm) on top of a suspended wire mesh with a 1 cm² grid to provide access to the ventral side of the hind paws, and acclimated to the test chambers for 20 minutes. The von Frey filaments were presented perpendicularly to the plantar surface of the selected hind paw, and then held in this position for approximately 8 seconds with enough force to cause a slight bend in the filament. Positive responses included an abrupt withdrawal of the hind paw from the stimulus, or flinching behavior immediately following removal of the stimulus. A 50% withdrawal threshold was determined using an up-down procedure (Dixon, 1980). A percent maximal possible effect (% MPE) of testing compound was calculated according to the formula: (Log [compound–treated threshold]–Log [vehicle–treated threshold])/(Log [maximum threshold]–Log [vehicle–treated threshold])×100%, where the maximum threshold was equal to 15 g.

The animals were housed in Association for Assessment and Accreditation of Laboratory Animal Care (AAALAC) approved facilities at AbbVie Inc. in a temperature-regulated environment under a controlled 12-hour light-dark cycle, with lights on at 6:00 a.m. Food and water were available ad libitum at all times except during testing. All testing was done following procedures outlined in protocols approved

by AbbVie Inc.’s Institutional Animal Care and Use Committee.
